Xylem can tailor services to reported inventory needs

Use state patterns to find candidate markets. Select pilots with utility-level evidence.

Identification emphasis	Texas and Pennsylvania
Replacement planning	Illinois
Parallel work	Ohio and New York

Research question

Where are lead service line infrastructure needs greatest across U.S. states?

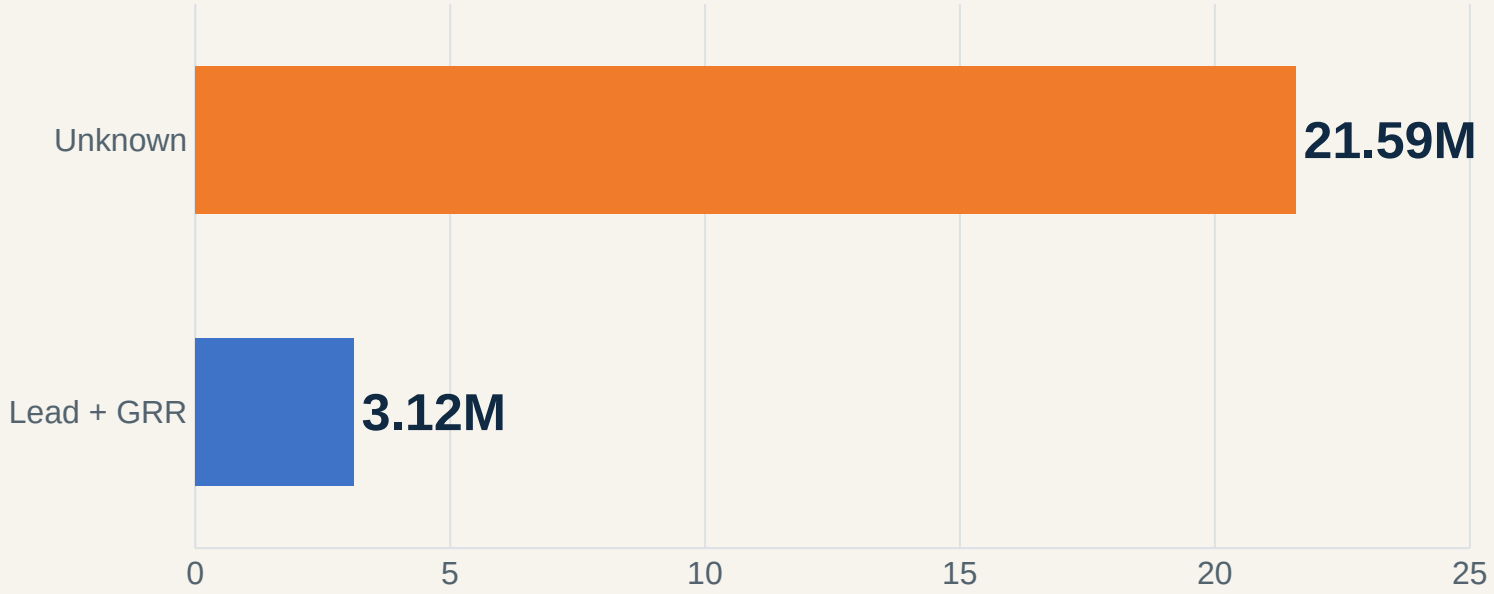

Identification = Unknown material Known Replacement = Lead + GRR

GRR = Galvanized Requiring Replacement

EPA 2026 Q2 inventory. Proposed business application, subject to utility-level assessment.

Unknown inventory is nearly seven times the known replacement inventory

Reported service lines, millions

6.9×

as many Unknown lines as known replacement lines

49 of 51

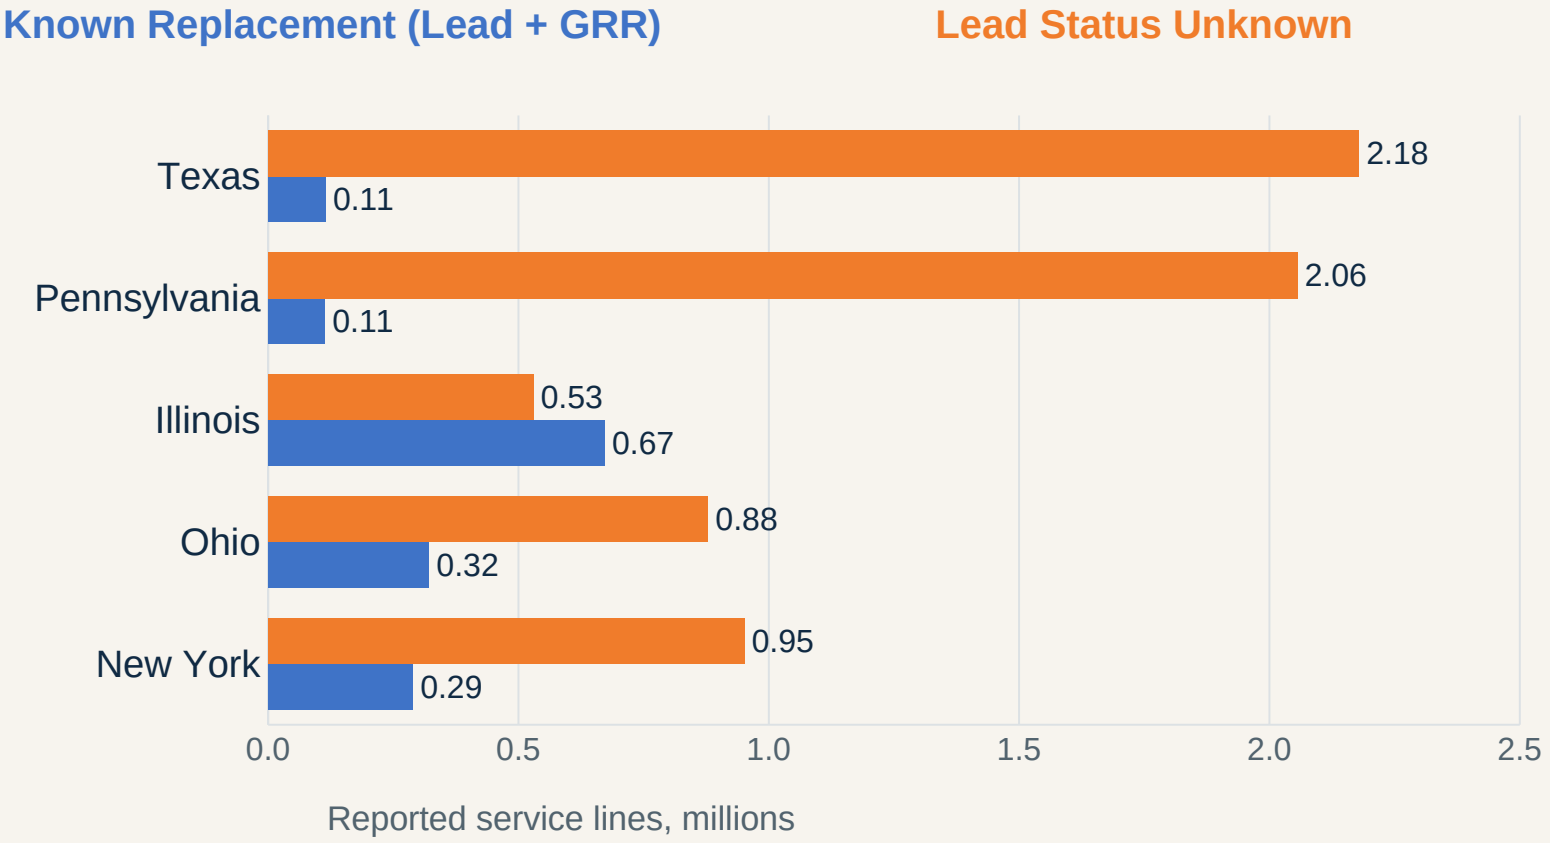

jurisdictions have more Unknown than Lead + GRR

Unknown lines need classification. Known replacement planning can proceed in parallel.

Unknown does not mean lead. Line counts do not measure relative cost or effort.

Source: EPA 2026 Q2. Counts reflect the analytical sample, not a complete national estimate.

Different inventory mixes support different service emphases

Identification emphasis

Texas + Pennsylvania

Replacement planning

Illinois

Parallel work

Ohio + New York

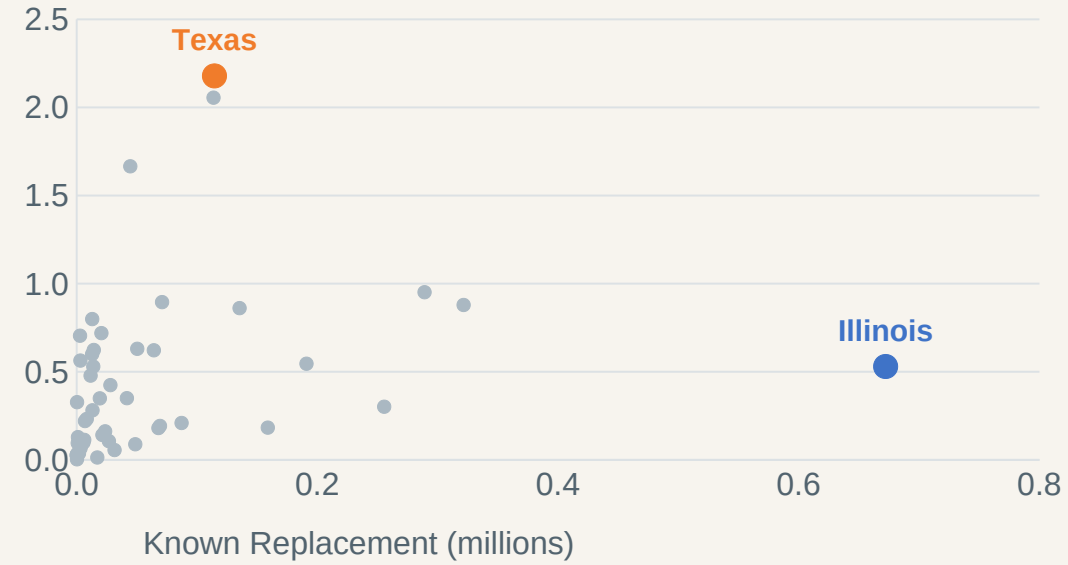

Complete-report coverage in these states: 91.4%–98.3% of listed systems.

Source: EPA 2026 Q2. Illustrative candidates; not statistical clusters or an exhaustive shortlist.

Population context changes comparisons
Reporting gaps also limit market conclusions

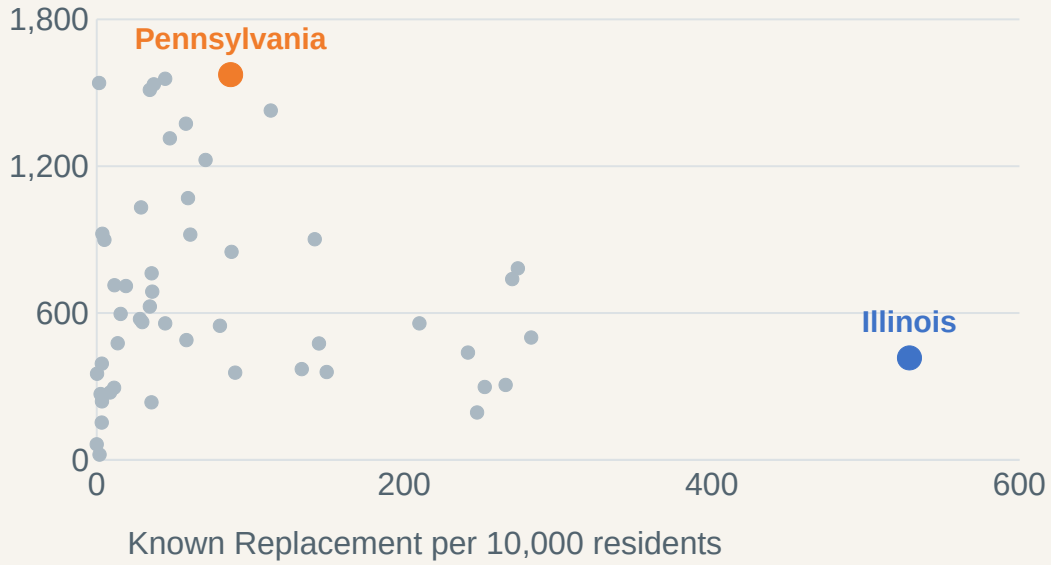

Absolute inventory

Y axis: Unknown (millions)

Inventory per 10,000 residents

Y axis: Unknown per 10,000 residents

Raw top 10 retained after population adjustment: 6/10 replacement; 3/10 Unknown.

New Hampshire: only 3 of 706 listed systems enter the sample. Low totals can reflect reporting gaps.

System coverage is not line coverage. Population rates do not estimate affected residents.

Sources: EPA 2026 Q2 and Census 2025. Each chart contains 50 states and DC.

PROPOSED NEXT ACTION

Utility screening should determine which pilots move forward

Documented Xylem capabilities support the approach

Detection, inventory development, funding assistance and replacement planning.
Confirm current service scope with Xylem before designing an engagement.

01	**Screen utilities**	Review material records and GIS. Assess funding, access and capacity.
02	**Define the pilot**	Agree on scope and starting inventory. Set a baseline and targets with the utility.
03	**Evaluate results**	Track classification and cost per verified line. Review progress toward replacement plans.

Which utilities have the inventory needs, data, funding and capacity to support a pilot?

Xylem capability sources: 2022 Asset Performance Optimization brochure pp 4–5; smart asset-management page.
