Where should Xylem focus its lead service line services?

Analysis of 43,993 Community Water Systems across 50 states and DC

The inventory points to two types of work

Identification

Determine the material of lines reported as Unknown.

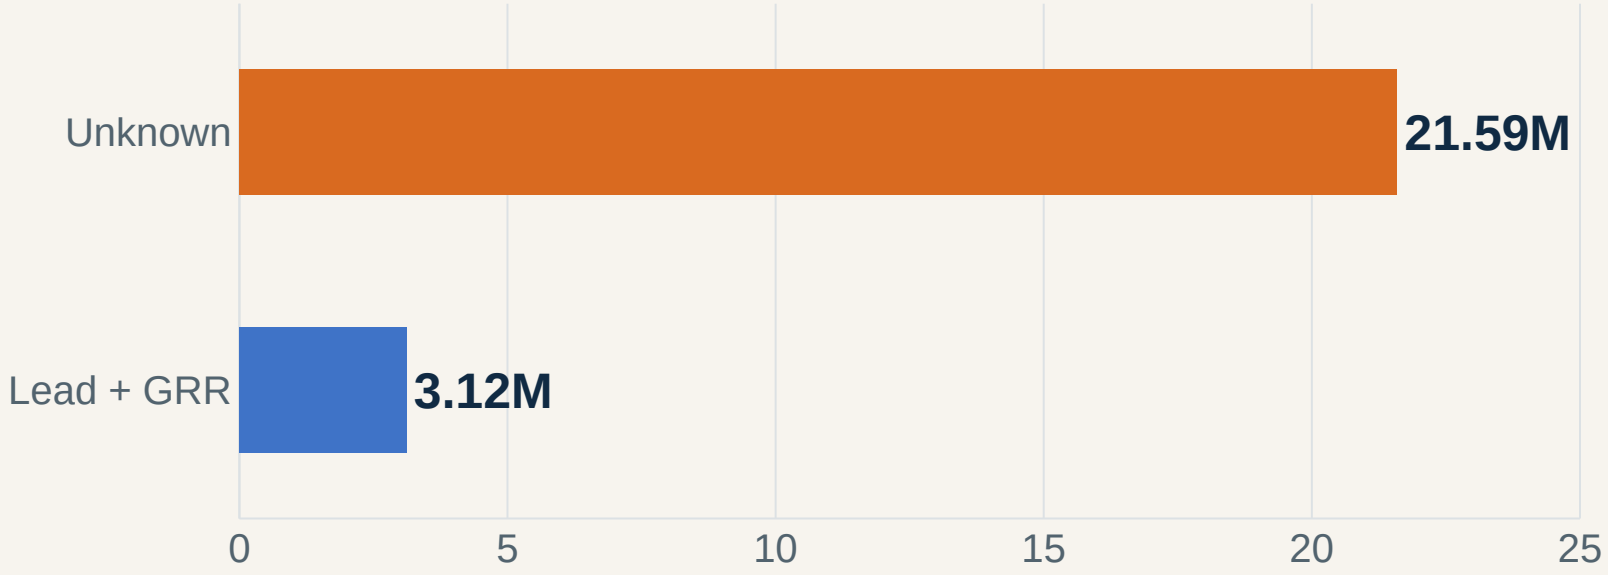

Replacement planning

Plan work for known lead lines and galvanized lines requiring replacement.

The business question: which service emphasis fits each market?

Unknown lines outnumber known replacement lines by 6.9 to 1

Reported service lines, millions

49 of 51

jurisdictions have more Unknown than known replacement lines.

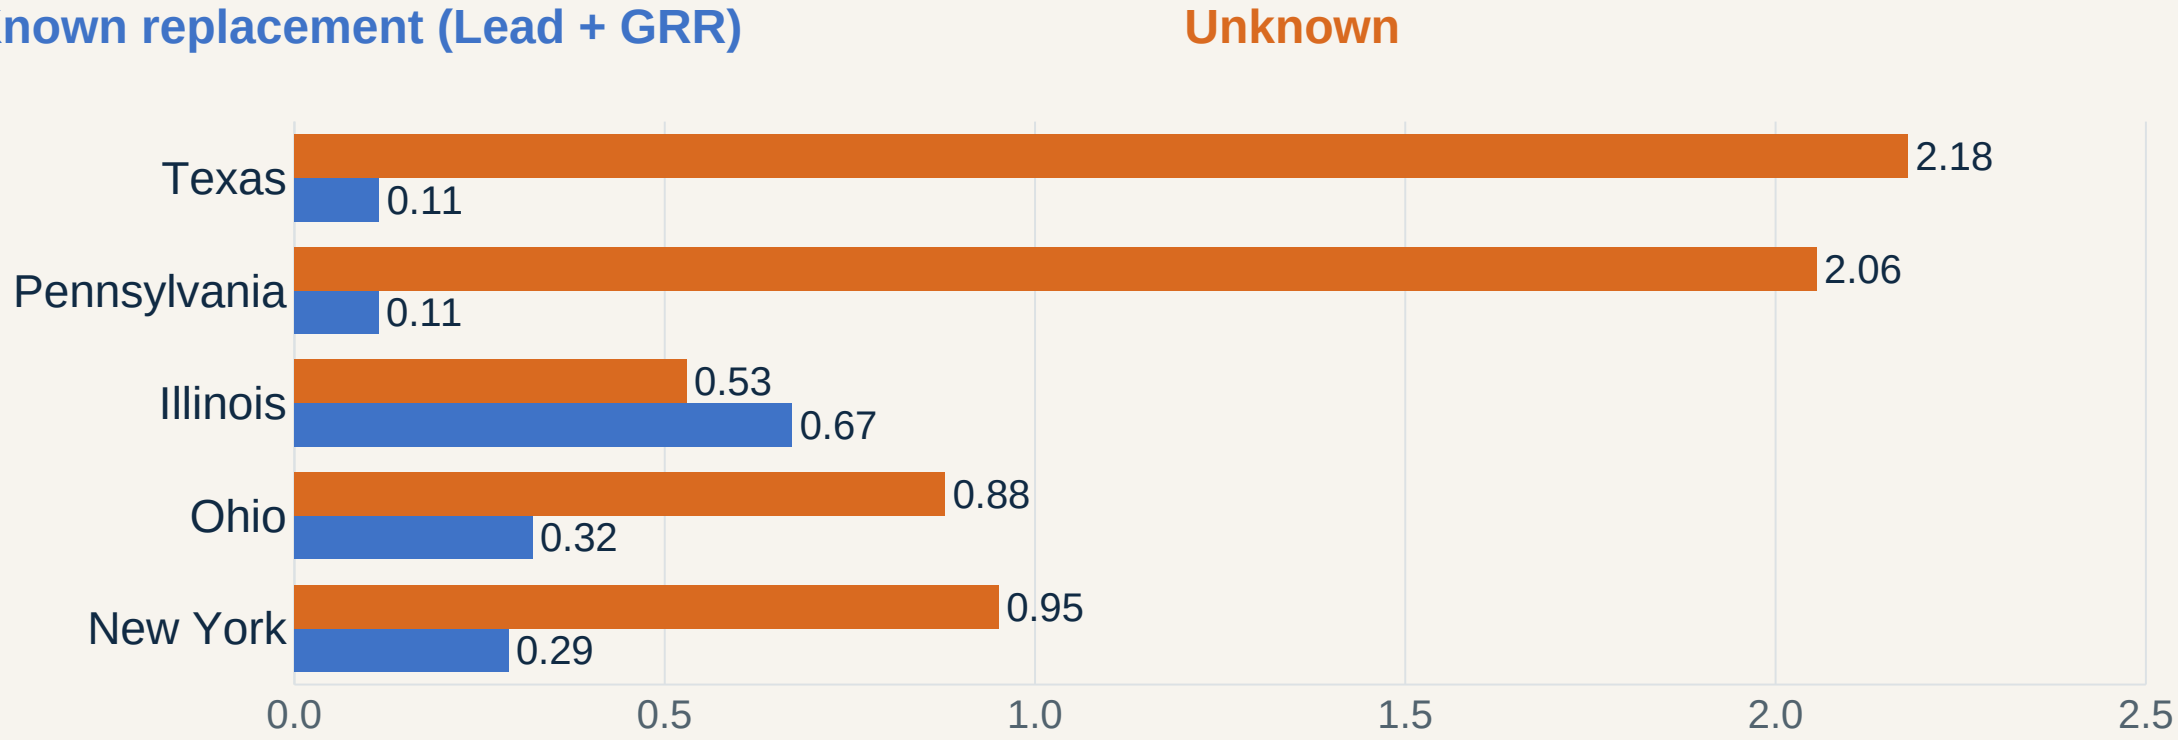

Identification deserves a central role in the proposed offering.

Unknown does not mean lead. GRR = Galvanized Requiring Replacement.

Source: EPA 2026 Q2. Reported inventory in the analytical sample.

The balance of work differs by state

Reported service lines, millions

Texas and Pennsylvania lead on Unknown lines. Illinois leads on known replacement.

Source: EPA 2026 Q2. Five illustrative markets, not an exhaustive shortlist.

Xylem could match its services to each market's inventory mix

Illustrative markets	Proposed emphasis	What Xylem could help utilities do
Texas and Pennsylvania	**Identification**	Verify Unknown materials and build usable service line inventories.
Illinois	**Replacement planning**	Prioritize known replacement lines and develop funded project plans.
Ohio and New York	**Both in parallel**	Resolve Unknown materials while planning known replacement work.

Xylem documents detection, inventory, funding and planning capabilities.

Proposed service emphases. Confirm current service scope and utility needs before delivery.

Capability evidence: Xylem Asset Performance Optimization brochure (2022), pp. 4–5.

Utility screening is the next decision

State patterns identify places to investigate. Utility evidence determines pilot fit.

01	**Check the inventory**	Reconcile utility records and GIS. Verify material classifications and reporting gaps.
02	**Assess feasibility**	Confirm funding, property access and delivery capacity. Agree on a pilot scope with the utility.
03	**Measure progress**	Track newly classified lines and cost per verified line. Assess progress toward an agreed replacement plan.

Coverage matters: the five examples include 91.4%–98.3% of listed systems.

System coverage is not line coverage. Low reported totals can reflect missing data.

Proposed next steps. State totals do not establish customer demand, funding or project readiness.
